

Heightening Shipping Efficiency for World Commerce

web-based enterprise shipping system

Transportation and execution may represent the closing of a customer order, but they are just as important as the rest of your global supply chain.

The communication of data to and from your shipping division has a significant impact on the bottom line.

About CMS WorldLink™

CMS WorldLink is a state-of-the-art web-based multi-carrier enterprise shipping application designed to address the shipping needs of both small and large businesses. This robust and scaleable solution is equally suitable in a single warehouse environment as well as multiple distribution centers located throughout the world.

CMS WorldLink can easily operate with virtually any host application by using standardized templates and communication methods hosted within your environment including SAP®, Oracle Financials®, JD Edwards® or any custom ERP system, allowing you to view shipping in the context of your other functions.

CMS WorldLink provides you with the power to manage and maintain all of your shipping points via a single application. You will benefit by centralizing shipping history reports, location cost reporting and carrier rules. Thus, significantly improving efficiency as well as cost savings and a standardized global shipping process regardless of location(s).

BENEFITS

Flexibility

CMS WorldLink's GUI is easily customizable or, if you prefer, CMS WorldLink can run in the background, using your system's front end to process transactions via the CMS WorldLink API.

Productivity and Customer Service Enhancements

Giving you the ability to dramatically reduce your shipping costs, decrease your shipping turnaround time and enhance your customer service offerings.

Global Visibility

Allowing all your worldwide shipping processes and data to be accessible by authorized personnel from anywhere in the world.

Rating Engine Independence

Providing your company flexibility in choosing the already built in, third party or carrier-supplied compliance engines that best suit your needs and preferences.

Variable Business Rules

Enabling you to have various business rules assigned to different stations, users and sites, all within the CMS WorldLink framework.

Database Flexibility

CMS WorldLink supports both Oracle® and/or Microsoft SQL Server® databases.

Designed With Today's Most Advanced Technologies

Windows 2003, Microsoft SQL Server & Oracle Database, .NET, COM+, C++, XML, OLEDB, ODBC, OLE Automation, Web Services, MTS, IIS & Crystal Reports

CMS GlobalSoft, Inc.

Supported CMS WorldLink Carriers

- FedEx®
- UPS™
- USPS®
- DHL Express®
- Expeditors®
- LTL & Generic
- BAX Global
- Purolator Courier®
- TNT Express
- Exel

capture even greater shipping productivity

Rate Shopping/Best Way

Employees can rate packages via deliver date across multiple carriers and multiple services. You can also balance delivery speed versus shipping cost.

ROI: This module ensures that you can ship at the lowest cost while maintaining the desired level of service.

E-mail Notification

Launch shipping notification e-mails to your senders/recipients that contain any information captured by CMS WorldLink, such as ship date, delivery method, tracking number and accessorial costs. Moreover, this module comes already configured to include a hyperlink to the carrier web site for self tracking by the recipient.

ROI: Lowers your incoming call volumes from senders/recipients seeking information about the delivery status of their packages.

Custom Reports & Labels

Companies wanting to build custom reports will benefit greatly from our Custom Reports Utility. CMS WorldLink uses Crystal Reports as a standard template writer. The Custom Label utility includes a library of sample compliance labels for various retailers.

ROI: Custom Reports gives the user flexibility to present or view historical information to suit business requirements, thus accelerating documentation compliance. This is especially useful when doing carrier negotiations or personnel productivity performance reviews. Moreover, you can create your own custom labels for a variety of uses, including internal purposes or to meet customer specifications.

Freight Configurator

Users can specify additional charges or discounts based on several different types of criteria. Once the shipment matches the criteria, the Bill As rate is adjusted accordingly.

ROI: Improve customer relations by discounting rates and/or adding fuel surcharges.

Consolidation/Ship With Other Shipments

This module enables you to consolidate orders on the fly, while also giving you the ability to automatically and easily update your Host database records with shipment information.

ROI: Ensures you don't miss opportunities to consolidate orders, thus achieving optimal cost savings.

Future Ship

The Future Ship module allows users to ship on a future date. Future Ship is ideal in allowing your company to prepare for impending higher-volume seasonal shipping, allowing you to pre-stage these shipments and distribute all or much of your high volume activity during slower, less pressured time periods.

ROI: This option allows you to ship packages in advance for release on a specific date so that you can better anticipate your higher volume days and eliminate errors due to time constraints.

e-Motion

CMS WorldLink's e-Motion module is the industry's first enterprise, in-motion shipping application that weighs, labels, manifests, and sorts parcels. For packages requiring labels, e-Motion's sophisticated technology manages a stunning 1,200 to 1,500 packages per hour on a single conveyor belt – and there are no limitations on the number of conveyors e-Motion can manage.

ROI: A hands-free environment allowing you to ship large quantities at a rapid speed without human intervention, thus allowing for reduced labor costs.

Bill of Lading

CMS WorldLink can create VICS compliant documentation including bill of lading, master bill of lading and all supplemental pages. Shipments can be consolidated for both published and discounted rates and can include customer defined adjustments.

ROI: Eliminates the need of using different software for small parcels and LTL's. It also gives you the capability of consolidating your LTL packages and re-rates them at a lower price.

Simulation Tool

Allows you to create "what if" scenarios, such as comparing the freight cost of specific shipments to actual customers, versus hypothetically using another carrier's service.

ROI: This analytical reporting tool will allow you to manage your freight distribution to specific carriers and regions with heightened efficiencies, resulting in actual lower shipping costs. It allows you to better negotiate with carriers per weight, region and/or country.

Multiple Organizations & Sites

With CMS WorldLink's Multiple Organizations module, you gain the ability to have different business rules as well as a unique interface, including unique ERP's assigned to different organizations. This module is ideal for 3rd Party Logistics Providers that have multiple customers and large corporations with independently operating divisions.

ROI: CMS WorldLink's Multiple Organizations & Sites module allows you to assign different business rules to different units and locations within your company. Given that Multiple Organizations & Sites are highly scalable, you have the option to add as many, or as few as your operations require—therefore augmenting business flexibility.

Ship As Bill As

This module gives your company the ability to ship a package at one service and bill at another. For example, you can send a package via FedEx Overnight, but charge the client at the UPS Ground rate. This module is often used by a manufacturer on a back ordered item. CMS WorldLink further extends the benefits by storing the published and discounted rates for both the shipped and billed methods.

ROI: This module gives you the flexibility to ship a package at one rate and bill at another; thus enhancing customer relations.

Address Verification

Verify the address data on your shipments as well as the difference between residential and commercial addresses.

ROI: Eliminate or minimize costs on address correction fees.

RFID

If your company is rallying to implement Radio Frequency Identification (RFID) capabilities into your distribution system, then you'll appreciate CMS WorldLink's RFID module. You'll gain the ability to easily generate shipment specific RFID tags, allowing you to implement the greater efficiency, accuracy and security demanded of your buyers and your own corporate processes.

ROI: This is the latest technology in the industry that allows for better visibility in the end-to-end process.

You can add these modules at any time, allowing you to keep your shipping application in lockstep with the evolution of your business model rather than forcing your business model to meet the limitations of your shipping solution.
